Rapid Prototyping of Application-Specific Signal Processors

Intergraph Corporation

Intergraph is developing an enterprise environment to improve product quality and reduce design time and cost. The enterprise environment will automate data and process management capabilities, ensure data availability and integrity, and ensure adherence to the best design practices.

Focus on RASSP

The Design Methodology Manager provides design flow enforcement and tracking. It is flexible enough to allow companies to specify and enforce design flows unique to their policies and processes. The Design Methodology Manager provides this support across all the different design disciplines required to engineer a finished product.

Intergraph's DM2 is a commercially available, off-the-shelf product suite to address the problems of managing data within a complex heterogeneous environment. It allows data access with little or no knowledge of storage loca-

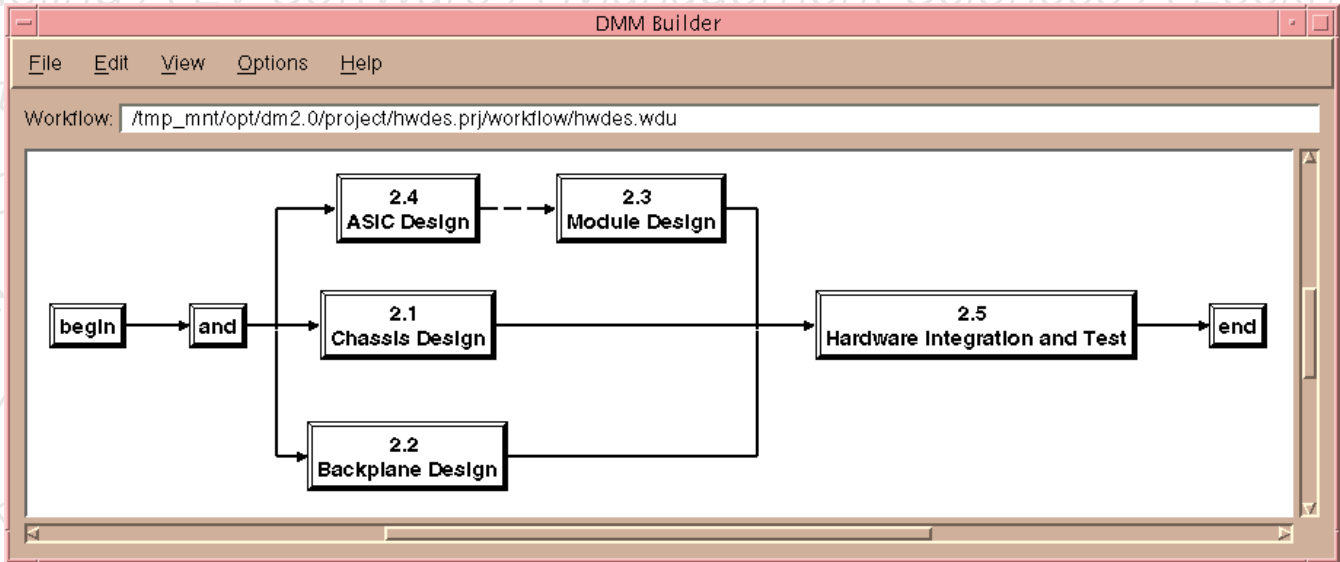

tions, hardware platforms, or database systems. DM2 provides an object-oriented infrastructure based on technology from Meta-phase. Intergraph adds value through application and industry expertise.

Object management capability provided by DM2 includes the following:

- Administration of users, groups, hosts and others
- Generic set of object classes and relationships
- Open architecture for the extension of the generic class hierarchy

Tools

Rapid Prototyping of Application-Specific Signal Processors

DM2 provides an object-oriented approach to data management.

- Object creation, storage, values, query
- Rules-driven security mechanism.

The architecture of DM2 facilitates the demands of enterprise-wide computing environment by providing scalability and the ability to distribute data across an enterprise's computing resources. Flexibility is provided by supporting a wide variety of platforms, network environments, and operating systems.

DM2 offers rich object modeling, rules-based processing for precise business modeling, a

scaleable architecture, and a configurable graphical user interface. Its open architecture enables the integration/encapsulation of third-party or customer-built products.

Intergraph is committed to providing the best-in-class combination of data management products, customization, and consulting services.
